

CSc 2010: PRINCIPLES OF COMPUTER SCIENCE

Lab 9

For this lab you will write a program with a main method and two other methods.

The main method handles all the user input and all the println statements. It asks the user to enter 3 numbers. The main method should call the two other methods and pass the three numbers to both of them. The main method should print out all the results.

The first other method is called calcLargestSum and it returns the sum of the two largest of the three numbers.

The second method is called calcMiddleNumber and it returns the middle number. (The one that is neither the smallest nor the largest.) You can assume that none of the numbers are the same.
